Notes: Institute of Transportation Engineers (ITE) 10th Edition *Trip Generation*. SANDAG *Brief Guide of Vehicular Traffic Generation*. Rates for the San Diego Region, April 2002. Anaheim and Victorville data from other traffic studies (details in Attachment C).

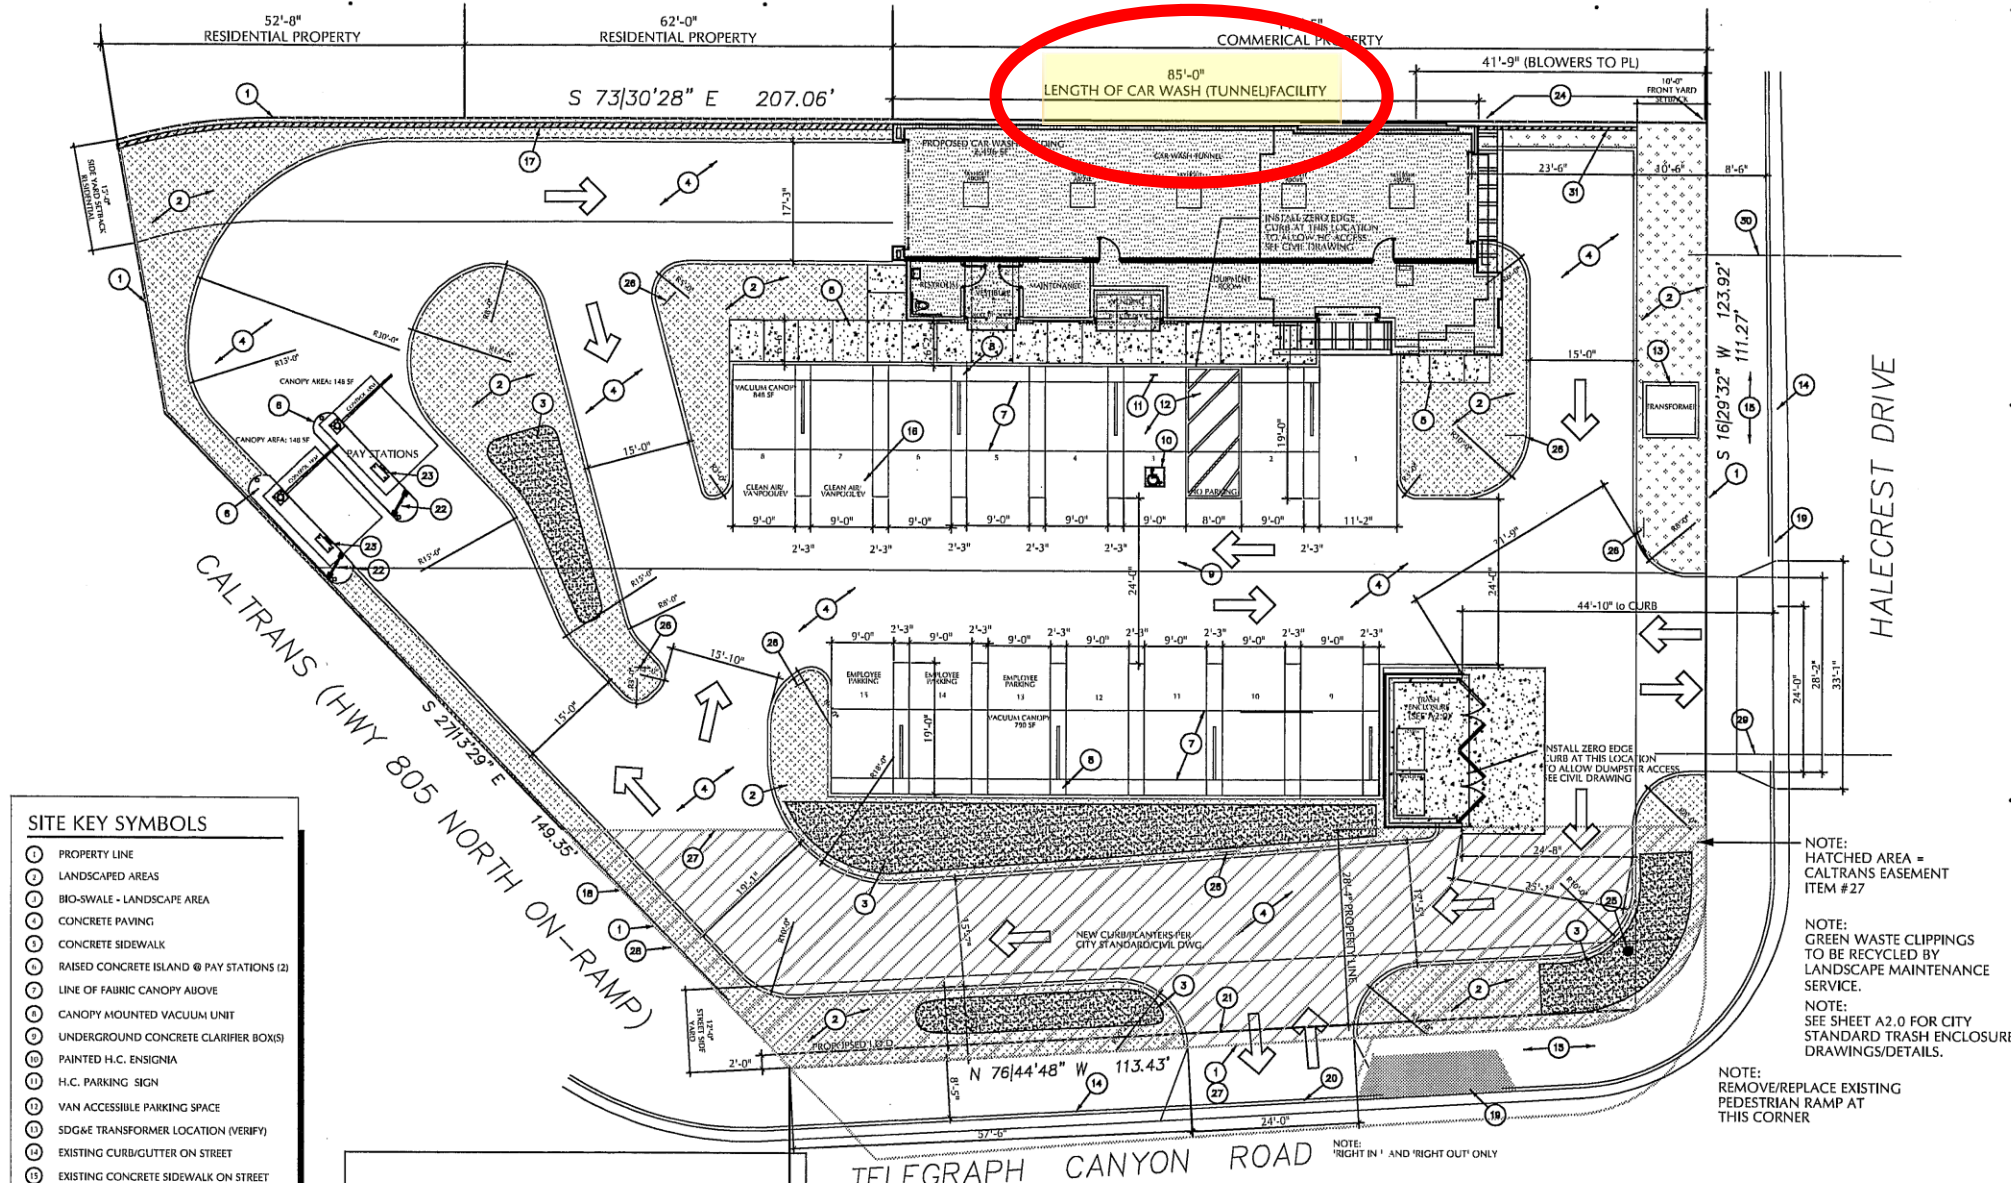

The proposed car wash has a significant potential to exceed the trip generation levels that would require a traffic study under City of Chula Vista and Caltrans' criteria.

New High Speed Car Washes Processes 90 Cars Per Hour, not 40 to 50 Free Vacuums Add Trips

Site Layouts

Full-Serve Car Wash

Definition:

Full-service car washing offers a robust number of profit opportunities yielding higher revenue per car. Greeted by a live attendant, the customer selects their wash level and extra services before exiting the vehicle to a retail waiting area or convenience store. While the customer is waiting, attendants take the vehicle through the wash, vacuum, clean windows, and perform other detailing services. Although popular with customers, it is labor intensive, and rising wages in some markets are leading full-service washes to increasingly use automated equipment normally used in express and flex-service operations to replace manual labor.

Every full-serve car wash represents different start-up parts, tools, and supply requirements, depending on the services offered. Sonny's offers convenient lists of the most popular items ordered with a new full-serve tunnel package. Want to customize it – give us a call or go online. With over 12,000 car wash items in stock for immediate delivery, chances are we'll have everything you need – priced right.

What is a Traffic Study?

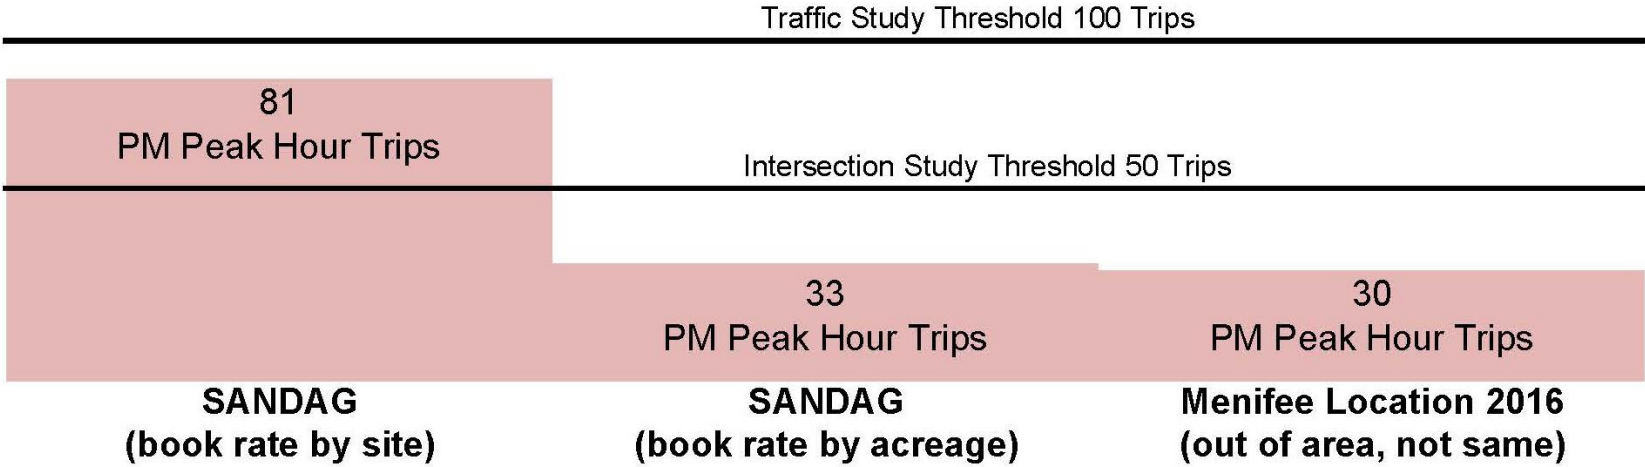

- Documents potential traffic impacts
- Follows specific City and Caltrans criteria, and requires agency review
- Includes intersections, segments, and freeways on-ramps
- Provides accurate trip generation information
- Accounts for other cumulative projects
- Addresses access operations: Level of Service (LOS)
- Properly addresses the California Environmental Quality Act (CEQA)
- Delivers recommendations to reduce traffic impacts, if required
- Provides objective findings for decision makers to make a fair and accurate decision

USA Memo is not a Traffic Study

- Urban Systems Associates, Inc. (USA) prepared a memo (no LOS analysis)
- References SANTEC/ITE guidelines when traffic study is required
 - Correctly notes the requirement of a traffic study if >100 peak hour trips
 - Correctly notes the need to study intersections with >50 peak hour trips
- References SANDAG trip generation rates
 - Concedes a PM peak hour trip rate of 81

USA Memo
book rates
and outliers

USA Memo

Data Outliers (abnormal distance from other variables)

USA Memo on Trip Generation

- USA Memo states “Finally, if there are unique site characteristics, estimation of trip rates or counts at other site are recommended.”
- USA did not collect traffic data at a nearby similar site (applicant operates a Wash N Go carwash in San Diego)
- USA did NOT have any LOS analyses

Wash N Go Rosecrans St at Cauby St

- Located in nearby San Diego
- Same type of car wash as the proposed project
- Operated by the applicant
- Adjacent to busy street (Rosecrans)

Rosecrans Wash N Go Data Collection

- Actual data collected on October 4, 2018
- This is a high-volume budget type car wash (doesn't match current book rates)
- PM Peak Hour = 144 Vehicles
 - 69 inbound
 - 75 outbound
- Queuing into street occurred for 8 minutes and 37 seconds over a 2 hour period

City: San Diego
 Location: Wash N Go Express Carwash
 Count Type: Driveway Counts - Driveway Off Cauby Street

USA Memo
vs. Actual
Data

Actual Data vs. Guessing

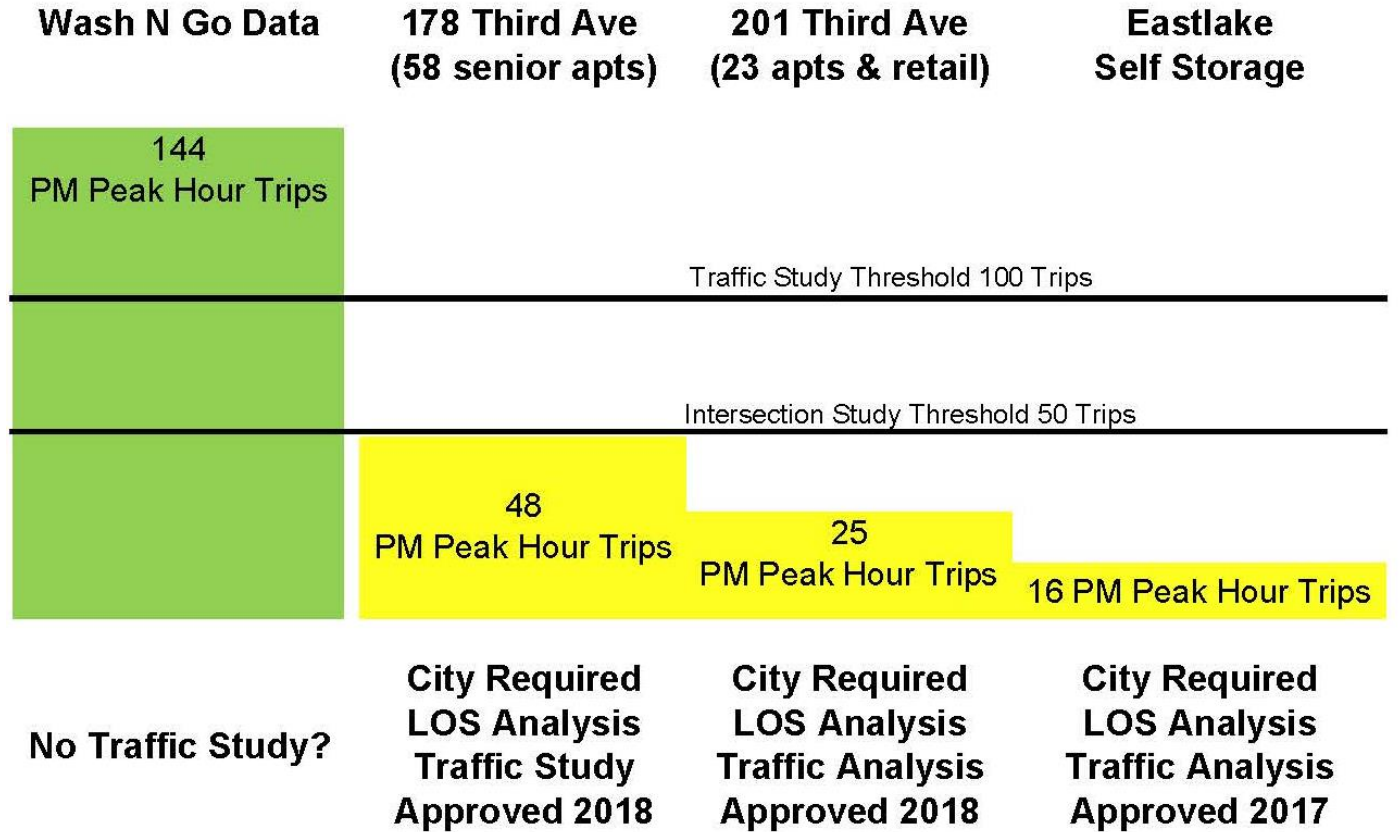

Rosecrans Wash N Go actual data = 144 PM peak hour trips

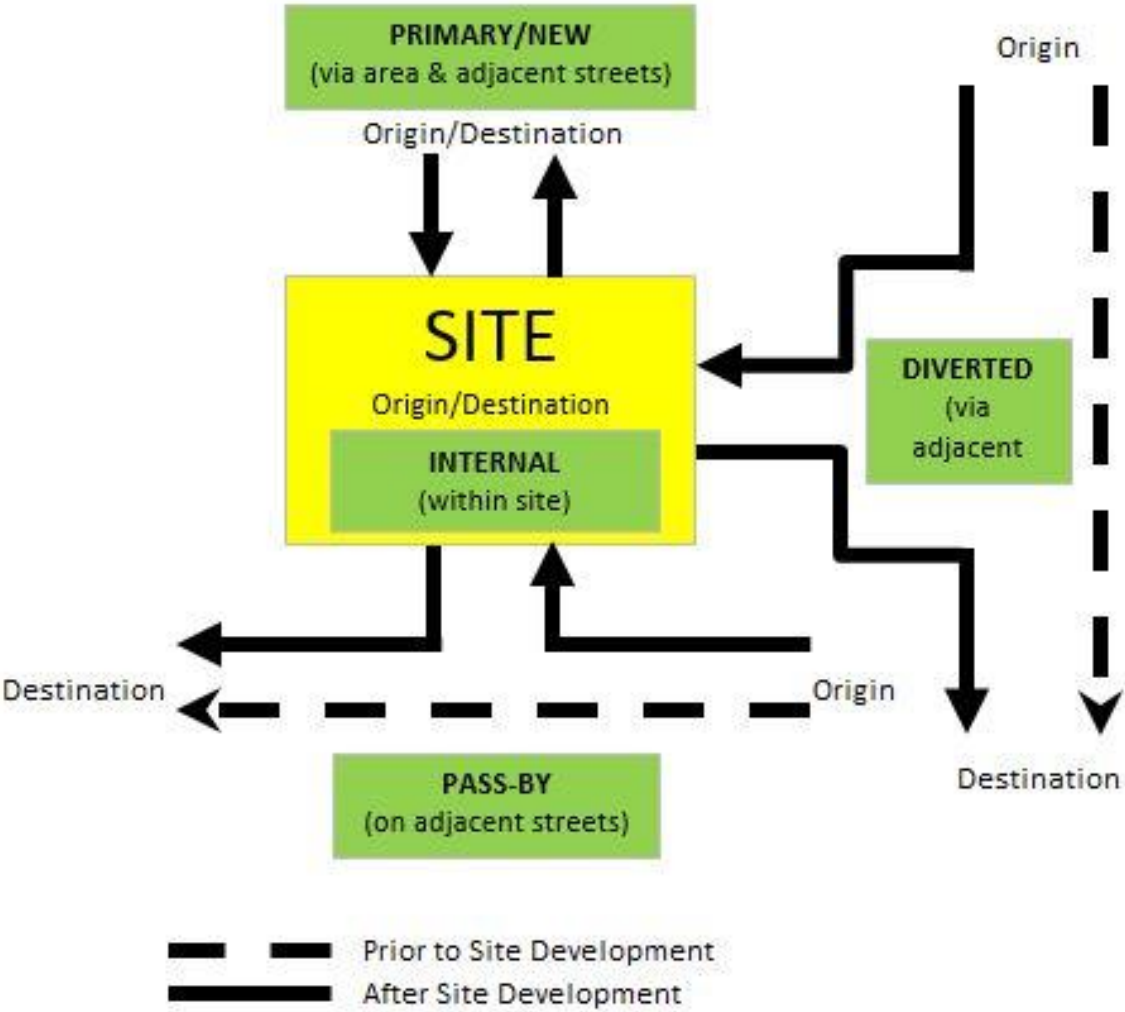

This exceeds the SANTEC threshold, therefore a traffic study is required to ensure the project traffic can be properly handled

Recently Completed Traffic Study and Analyses

Understanding Driveway Trips (hard way)

Understanding Driveway Trips (easy way)

City of San Diego

TRAFFIC IMPACT STUDY MANUAL

Study Area

The contents and extent of a traffic impact study depend on the location and size of the proposed development and the conditions prevailing the surrounding area. Larger developments proposed in congested areas obviously require a more extensive traffic impact study. Smaller sites may require only minimal analysis. An inappropriately large analysis area will unnecessarily increase costs and time to the developer, the study preparer and the reviewer. In addition, large volumes of meaningless analysis can obscure the real issues that need to be addressed. At a minimum, any traffic impact study must address site access and adjacent intersections, plus the first major signalized intersection in each direction from the site. Beyond this minimum requirement, all known congested or potentially congested locations that may be impacted by the proposed development should be studied. The following methodology based on Average Daily Traffic (ADT), project trip distribution and generalized daily roadway capacity has been prepared to offer some predictability to consultants bidding for jobs and to determine an initial study area to discuss with City staff. Knowledge of the area and judgement may cause the study area to be either expanded or contracted.

Procedure for Determining Initial Study Area

1. Calculate project trip generation based on driveway trip rates and standard City trip generation rates.

Driveway Trips vs. Adjacent Street (easy way)

City of San Diego

TRAFFIC IMPACT STUDY MANUAL

Driveway Volumes Versus Traffic Added to the Adjacent Streets

It is usually assumed that all trips entering and exiting a new development are new trips that were not made to or through the area prior to the development being completed. However, a portion of these trips may be “captured” from trips already being made to other existing developments on the adjacent street system. Any commercial real estate agent will confirm that the three most important factors in a successful retail business are location, location and location. This phenomenon has been verified by limited studies of commercial sites. The City's Trip Generation Manual has recommended a percentage reduction in driveway trip generation rates for numerous retail uses. These recommendations are based on local and national trip generation studies, as well as SANDAGS's Travel Behavior Study conducted in 1985. The pass-by reduction includes true pass-by trips that were on an adjacent street and a portion of the linked trips that were diverted off a nearby route. The report must clearly indicate the new trips and the pass-by trips for the site. All site access points should be evaluated using the higher driveway rates, whereas far off intersections will be evaluated using the reductions for pass-by trips. The next chapter provides guidance on how to distribute and assign pass-by trips.

What other uses
generate 144
PM peak hour
driveway trips?

Wash N Go Data

144 Homes

55,000 SF Office

40,000 SF Retail

| | | | |
|---------------------------------------|---------------------------|---------------------------|---------------------------|
| 144 PM Peak Hour Trips | 144 PM Peak Hour Trips | 143 PM Peak Hour Trips | 144 PM Peak Hour Trips |
| Traffic Study Threshold 100 Trips | | | |
| Intersection Study Threshold 50 Trips | | | |

Precedence Setting?

If a traffic study is not required for a project that has been shown to generate more than 100 peak hour trips, does this establish a precedence for all other applicants?

Halecrest Dr Blockage and Spill Back

- On Sept 11, 2018, applicant's driveway was blocked 37 times between 4-6 PM (total of 23 minutes and 11 second)
- Blocked 20% of the time during PM Pk Hr
- Blockage creates spillback to Telegraph

| | Blockage Ends | Time Blocked | |

Halecrest Dr Driveway Blockage

- If one Wash N Go patron stops, it will create a spill back to Telegraph Canyon Rd as shown in the picture
- Any spillback will adversely impact access to the ARCO business
- Any spillback will delay access to residential areas north of the site

**PM Peak Hour
(Actual Halecrest Data)**

One Car Away From Catastrophe

Effectiveness of Do Not Block Intersection Signs

J. L. GATTIS AND ZAFAR IQBAL

On higher-volume streets the traffic queues that form at signalized intersections may back up and block access into or out of side streets and driveways. Owners of abutting businesses and residents whose access is repeatedly denied by these blockages sometimes complain to municipal officials and request police action or a sign prohibiting blocking the

sign may be found at unsignalized intersections in other cities, such as Dallas, Texas, Springfield, Missouri, and Fayetteville, Arkansas.

LITERATURE REVIEW

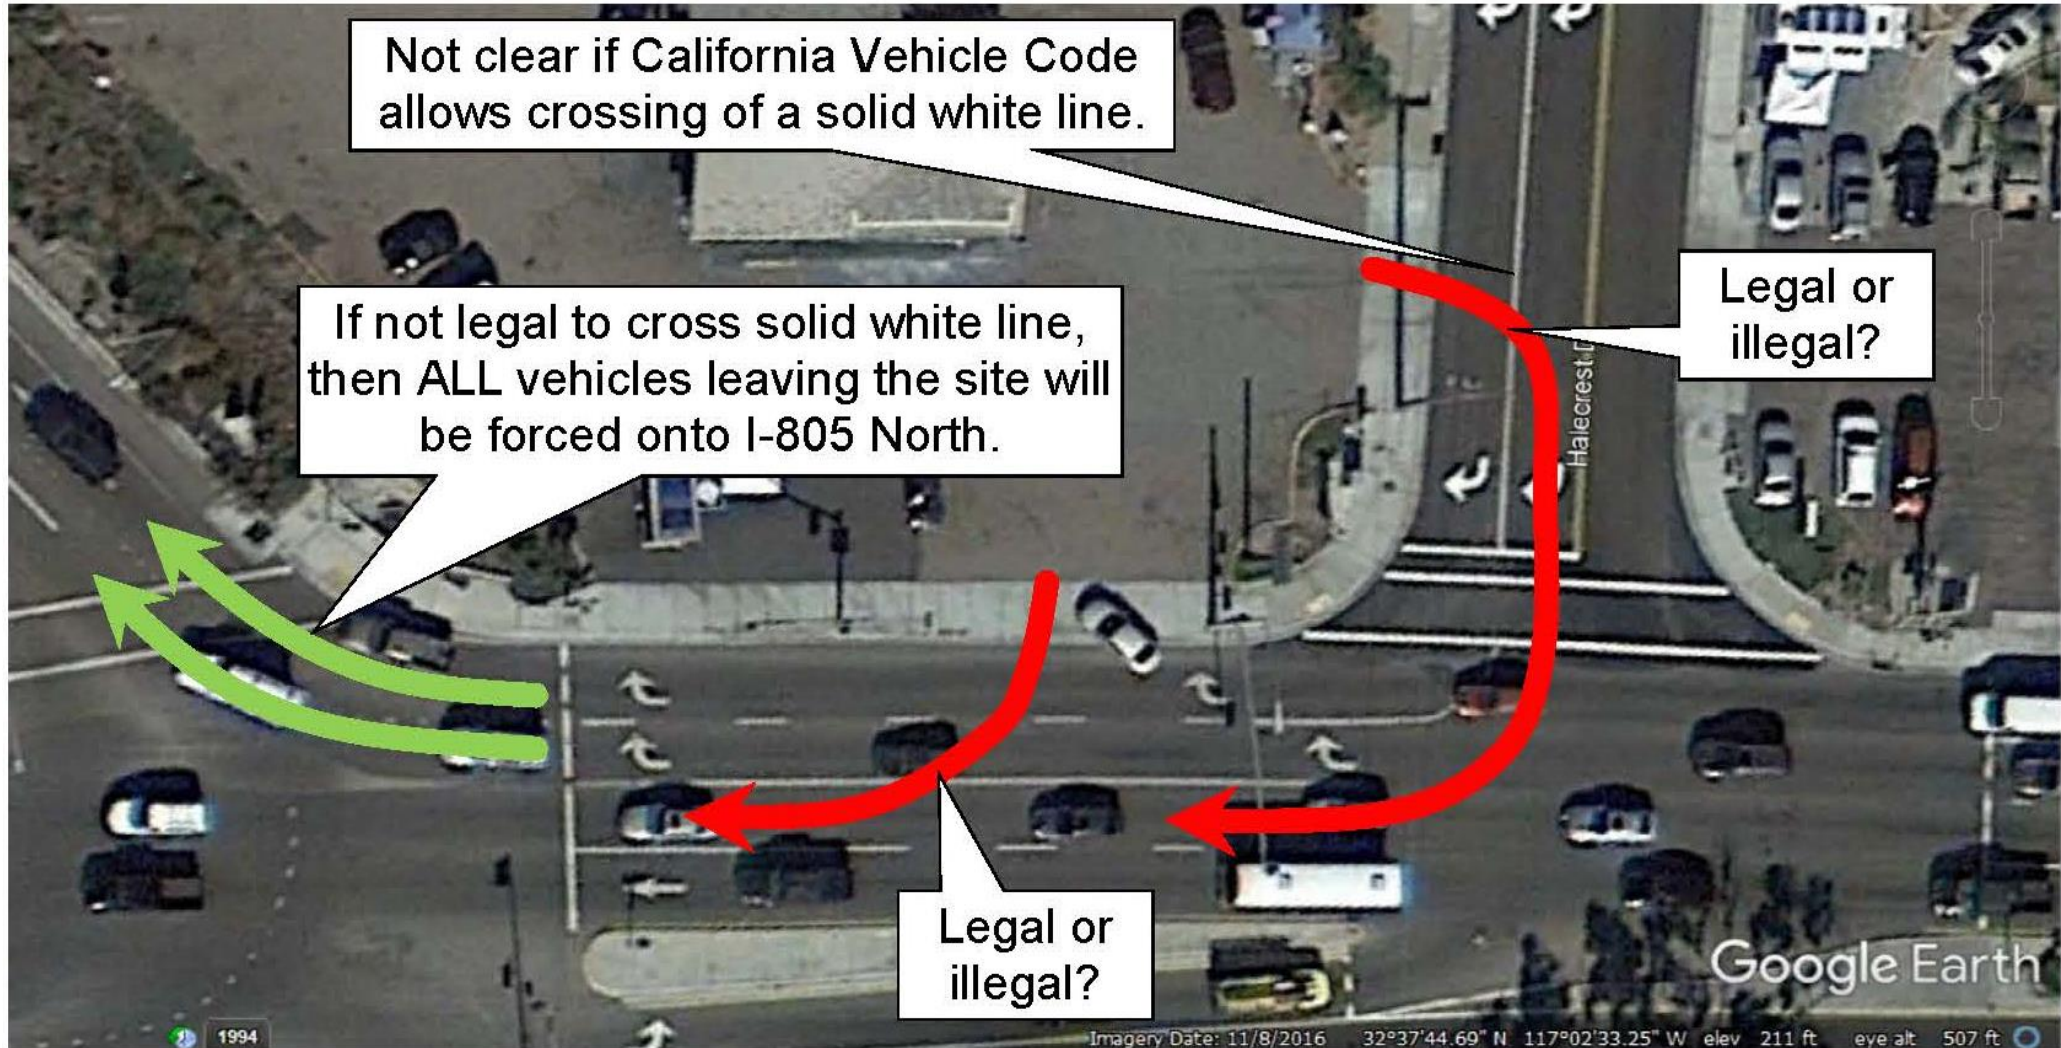

Gattis and Iqbal

blockages at three of the four sites. Only at Site A was the sign associated with a reduction in intersection blockage; it was the only site where the arterial street had a median, and there was an opening in the median for the driveway. Compared with the other three sites, this site had heavier volumes into and out of the driveway/side street. The combination of the setting and the median opening appeared to make this site more visible to approaching arterial motorists.

The vehicles at the study sites were almost exclusively passenger cars. From the present study it is not known whether significant amounts of truck or bus traffic would affect the proportion of the time an intersection remained unblocked.

Two conclusions were made. First, the research suggest that the effectiveness of the Do Not Block Intersection/Drive sign is minimal. The study indicated that installation of the sign may be a waste of time and effort in many situations. Second, to prevent undesirable traffic patterns from arising in the first place, the study reinforced the need to have access controls that prevent side streets and driveways from being located too close to arterial street signalized intersection approaches. The distance D from the signalized intersection to the upstream side street or driveway should be estimated by the equation

How Will Vehicles Leave?

Caltrans
Facilities

USA Memo states “it is estimated 30% of project traffic may use the freeway”

From actual data, the Wash N Go outbound PM peak hour is 75 vehicles

30% of 75 vehicles is 23, which exceeds 20 peak hour trips triggering the need for an on-ramp meter analysis (provided all vehicles are not forced to I-805)

Caltrans needs to be made aware of any potential impacts to their facilities

Benefits of a Traffic Study

- Does not stop development, rather identifies potential problems and how to fix them
- Makes sure on-site circulation works, proper ingress without spill back onto Telegraph Canyon Road, and proper egress
- Fulfills CEQA requirements
- Provides an objective analysis based on actual site-specific data
- Treats neighbors with respect by answering their questions

Conclusion

Actual data from a nearby Wash N Go clearly shows that a traffic study is required

Caltrans will be affected and should review the traffic study

Access to the adjacent ARCO will be impacted and this must be addressed

Let the CEQA do its job and address neighbors' concerns

Conclusion

Menifee

Telegraph Canyon Rd.

Conclusion

Menifee

Telegraph Canyon Rd.

Conclusion

CEQA Exemption § 15332 for In-Fill Developments Does Not Apply

- (d) Only applies if approval of the project would not result in any significant impacts to traffic or noise
- The unusual circumstances exception (to § 15332) requires some CEQA analysis as the location of the project is adjacent to an already impacted intersection and highway or ramp, i.e.: not a typical infill project
- There is a reasonable possibility that the unusual circumstance based on the “fair argument” standard will produce a significant effect on the environment

A baseline analysis must be for existing conditions, not a condition that existed in 2005

- when the site and adjacent street were different.

World Business Academy v. State Lands Com. (2018) 24 Cal.App.5th 476.
